Autosave and Concurrent editing (conflict resolution) in Drupal 8

Hristo Chonov

biologis Genetic Information Management GmbH - www.biologis.com

Hristo Chonov

Senior Software Engineer

■ Official Co-Maintainer of Drupal 8 Core Entity API

Author and/or main maintainer/developer:

- Autosave Form
- Conflict (8.x-2.x)
- Prefetch Cache
- Widget on Demand
- Entity Reference Inline
- Entity Reference Revisions Inline

Hristo Chonov (hchonov)

Current Role(s):
Senior Software Developer

Personal Info

Primary language: Bulgarian

Languages spoken: Bulgarian
English
German

Bio:

Entity API (ORM) Maintainer for Drupal 8 Core

History

On Drupal.org for 5 years 5 months

Over 5 edits to documentation

Drupal events:

DrupalCon Amsterdam 2014

DrupalCon Barcelona 2015

DrupalCon Dublin 2016

DrupalCon Vienna 2017

Drupal Europe 2018

Frankfurt am Main

Flagship product: GIMS

The knowledge of human genes, their variants and related medical facts is rapidly growing. At the same time, the effort of interpreting that data is also increasing. Identifying correlations or taking appropriate measures requires the aid of special tools.

bio.logis is developing services and IT applications for managing human genetics information in order to make our "genetic code" accessible and usable. Our [Genetic Information Management Suite \(GIMS\)](#) provides combined genetic data to enable decision making with a medical value.

GIMS consists of a web-based authoring and content management system based on Drupal, globally connecting expert knowledge, along with a genetic reports engine. A multilingual portal and mobile applications offer access to medial-ready knowledge for physicians, patients and healthy clients to support distributing and scaling genetics advice. The "pharma.sensor" online application provides ideas about adjusting drug therapies to your individual genetic makeup.

Drupal services

Based on our expertise on building products on top of Drupal and the individual drupal expertise of our developers we offer various Drupal services – especially for the healthcare sector.

OCTOBER 28-31

Autosave Form

Autosave Form

- continuous autosaving of the form
 - user input
 - form state
- configuration options
 - autosave interval (default - 60 seconds)
 - enable only for specific entity types & bundles (default - all)
- currently supported forms
 - content entity forms (default - all)
 - config entity forms support will be added on request

Autosave Form - Internals

- Decorates the core form builder for autosave submissions
 - speeds up autosave submissions
 - prevents form & entity validation
 - prevents hook invocations
 - prevents altering the user input and form state
 - prevents updating the form build ID

Autosave Form - States

■ Autosave states

- autosave states are per user i.e. represent drafts per user
- new state only when the form has actually changed (after previous autosave)
- allows for implementing an undo and redo functionality on top

■ On entity form save

- with conflict module enabled - only the autosave states of the current form session are deleted
- without conflict module - all autosave states for the entity being edited are deleted
 - if there are other active autosave sessions then they will be stopped and their users will be notified through a pop-up dialog

Autosave Form - Future

■ Use the browser local storage

- no active internet connection required
- conserves bandwidth and server processing time

■ Save autosave states as forward revisions in a revision branch

- Technical limitations
- DB Not Null Constraints
- New inline entities
- non-revisionable entity types

■ Core inclusion? - Implement Autosave [#3029488]

■ Your ideas and requests ...

Conflict

Branch - 8.x-2.x

Conflict - Concurrent Editing

- makes concurrent editing of entities possible
- content entity types
 - revisionable
 - non-revisionable
- config entity types
 - not supported yet

Conflict - Internals

- Entity handler - adds a conflict entity builder to entity forms
 - Conflict detection using a 3-way comparison for each field using
 - the initially used entity to generate the form
 - the current entity built from the form values
 - the entity from the storage (possibly a newer one)
 - default auto-merging
 - event system for extended conflict discovery & resolution

Conflict - Auto-Merge

- fields not enabled in the currently used entity form display
- fields the current user has no access to
- translatable fields from other entity translations
- entity metadata - changed timestamp, revision metadata
- fields changed only either in the current form or in the newest storage version
 - otherwise there is a non-auto mergeable conflict

Conflict - Discovery & Resolution

■ EntityConflictDiscoveryEvent

- left, right and base entities
- context as parameter bag (form, form state, form display, revision branch metadata...)
- => building a list of conflicting properties (fields)

■ EntityConflictResolutionEvent

- + result entity
- + conflicts list
- => resolves automatically conflicts and removes them from the list

Conflict - Manual Resolution

■ Still in progress ... but some basic functionality:

■ Dialog Based

- main target - nested inline entity forms
- integration tested with the module Entity Reference Inline

■ Inline Based

- main target - regular entity forms

■ a mix of both?

Conflict - Future

■ Auto merge of text fields with diff highlighting

- <https://xiphe.net/jQuery-Merge-for-php-diff/>

New Version

```
1<html>
2  <head>
3    <meta http-equiv="Content-type" content="text/html; charset=utf-8"/>
4  <title>Goodbye Cruel World!</title>
5 </head>
